In this document, the dynamics of the nano-hexapod shown in Figure 0.1 is identified.

Note

Here are the documentation of the equipment used for this test bench:

- Voltage Amplifier: PiezoDrive PD200
- Amplified Piezoelectric Actuator: Cedrat APA300ML
- DAC/ADC: Speedgoat IO313
- Encoder: Renishaw Vionic and used Ruler
- Interferometers: Attocube

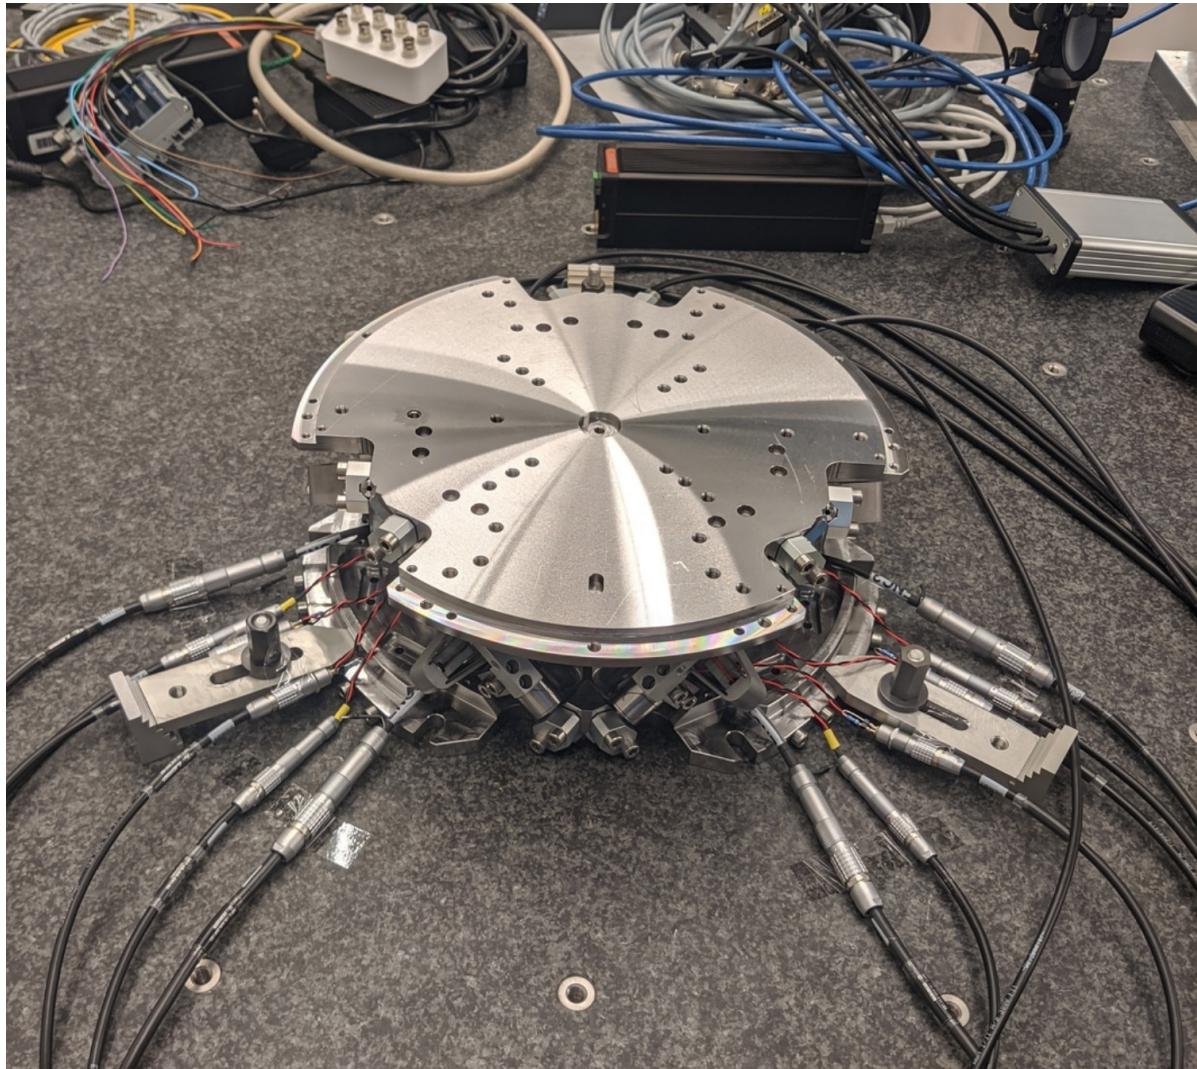

Figure 0.1: Nano-Hexapod

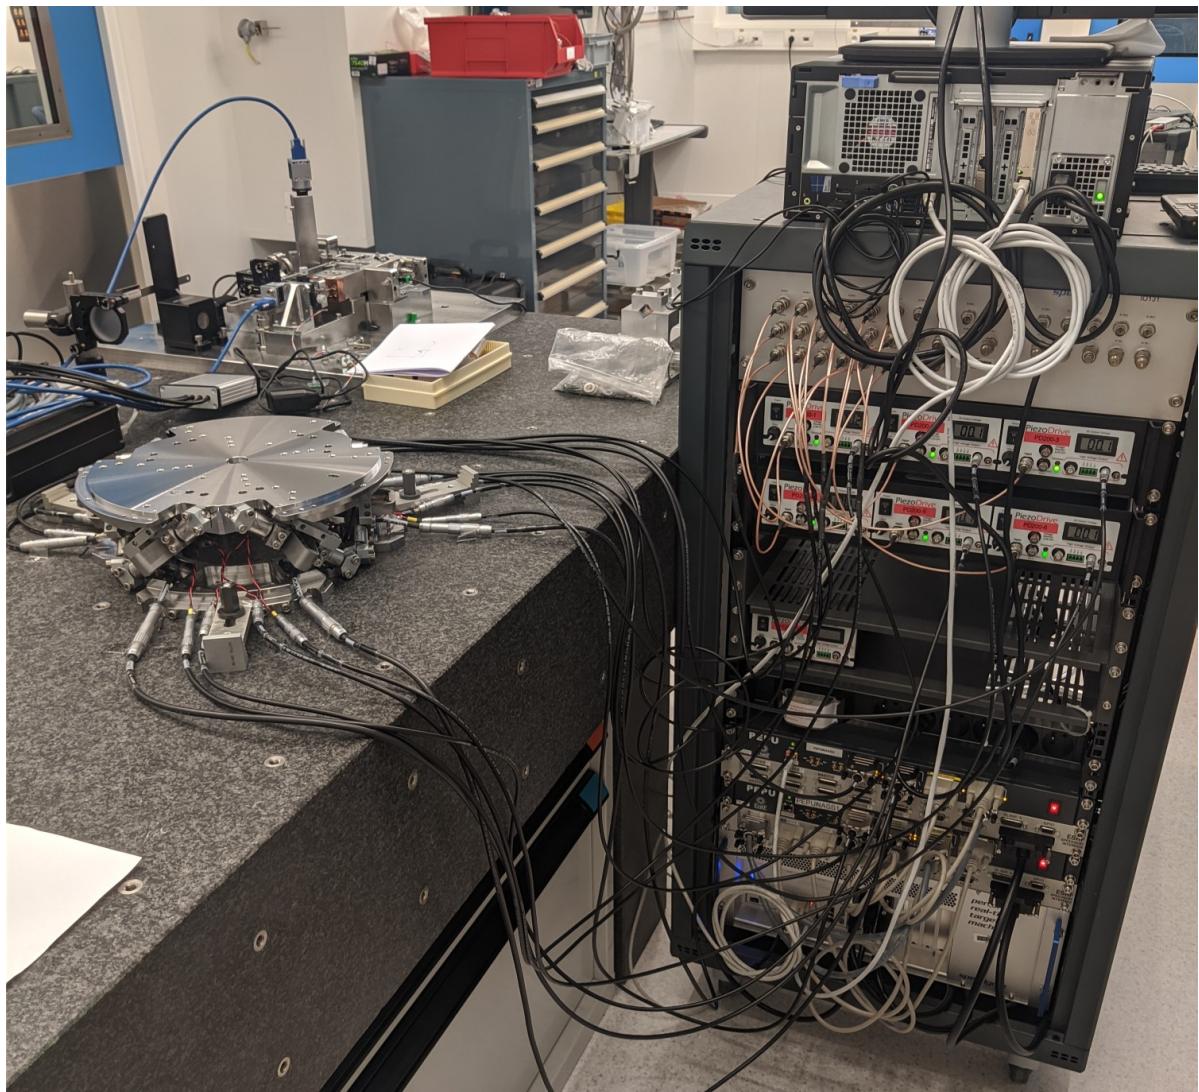

Figure 0.2: Nano-Hexapod and the control electronics

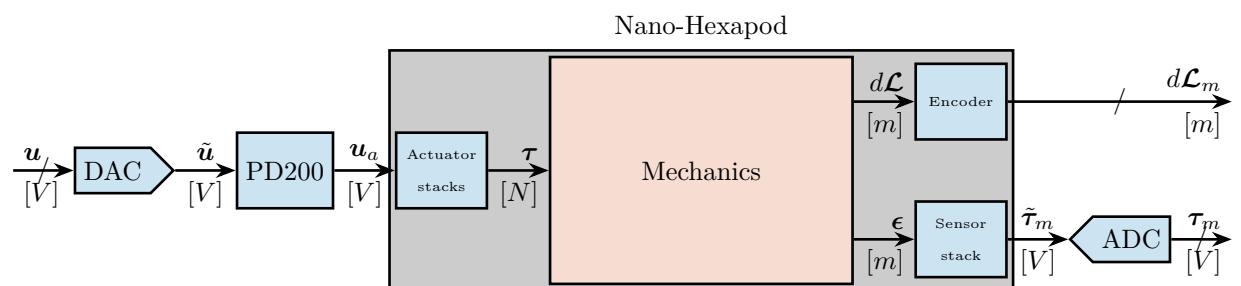

Figure 0.3: Block diagram of the system with named signals

Table 0.1: List of signals

	Unit	Matlab	Vector	Elements
Control Input (wanted DAC voltage)	[V]	u	\mathbf{u}	u_i
DAC Output Voltage	[V]	u	$\tilde{\mathbf{u}}$	\tilde{u}_i
PD200 Output Voltage	[V]	ua	\mathbf{u}_a	$u_{a,i}$
Actuator applied force	[N]	tau	$\boldsymbol{\tau}$	τ_i
Strut motion	[m]	dL	$d\mathcal{L}$	$d\mathcal{L}_i$
Encoder measured displacement	[m]	dLm	$d\mathcal{L}_m$	$d\mathcal{L}_{m,i}$
Force Sensor strain	[m]	epsilon	$\boldsymbol{\epsilon}$	ϵ_i
Force Sensor Generated Voltage	[V]	taum	$\tilde{\boldsymbol{\tau}}_m$	$\tilde{\tau}_{m,i}$
Measured Generated Voltage	[V]	taum	$\boldsymbol{\tau}_m$	$\tau_{m,i}$
Motion of the top platform	[m, rad]	dX	$d\mathcal{X}$	$d\mathcal{X}_i$
Metrology measured displacement	[m, rad]	dXm	$d\mathcal{X}_m$	$d\mathcal{X}_{m,i}$

1 Encoders fixed to the Struts

1.1 Introduction

In this section, the encoders are fixed to the struts.

1.2 Identification of the dynamics

1.2.1 Load Data

```
_____  
Matlab  
_____  
%% Load Identification Data  
meas_data_lf = {};  
  
for i = 1:6  
    meas_data_lf(i) = {load(sprintf('mat/frf_data_exc_strut_%i_noise_lf.mat', i), 't', 'Va', 'Vs', 'de')};  
    meas_data_hf(i) = {load(sprintf('mat/frf_data_exc_strut_%i_noise_hf.mat', i), 't', 'Va', 'Vs', 'de')};  
end
```

1.2.2 Spectral Analysis - Setup

```
_____  
Matlab  
_____  
%% Setup useful variables  
% Sampling Time [s]  
Ts = (meas_data_lf{1}.t(end) - (meas_data_lf{1}.t(1)))/(length(meas_data_lf{1}.t)-1);  
  
% Sampling Frequency [Hz]  
Fs = 1/Ts;  
  
% Hannning Windows  
win = hanning(cell(1*Fs));  
  
% And we get the frequency vector  
[~, f] = tfestimate(meas_data_lf{1}.Va, meas_data_lf{1}.de, win, [], [], 1/Ts);  
  
i_lf = f < 250; % Points for low frequency excitation  
i_hf = f > 250; % Points for high frequency excitation
```

1.2.3 DVF Plant

First, let's compute the coherence from the excitation voltage and the displacement as measured by the encoders (Figure 1.1).

```

Matlab
%% Coherence
coh_dvf_lf = zeros(length(f), 6, 6);
coh_dvf_hf = zeros(length(f), 6, 6);

for i = 1:6
    coh_dvf_lf(:, :, i) = mscohere(meas_data_lf{i}.Va, meas_data_lf{i}.de, win, [], [], 1/Ts);
    coh_dvf_hf(:, :, i) = mscohere(meas_data_hf{i}.Va, meas_data_hf{i}.de, win, [], [], 1/Ts);
end

```

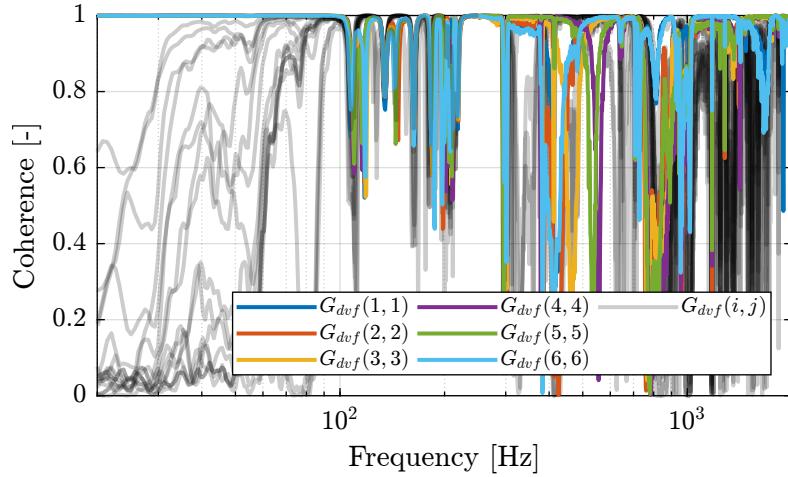

Figure 1.1: Obtained coherence for the DVF plant

Then the 6x6 transfer function matrix is estimated (Figure 1.2).

```

Matlab
%% DVF Plant (transfer function from u to dLm)
G_dvf_lf = zeros(length(f), 6, 6);
G_dvf_hf = zeros(length(f), 6, 6);

for i = 1:6
    G_dvf_lf(:, :, i) = tfestimate(meas_data_lf{i}.Va, meas_data_lf{i}.de, win, [], [], 1/Ts);
    G_dvf_hf(:, :, i) = tfestimate(meas_data_hf{i}.Va, meas_data_hf{i}.de, win, [], [], 1/Ts);
end

```

1.2.4 IFF Plant

First, let's compute the coherence from the excitation voltage and the displacement as measured by the encoders (Figure 1.3).

```

Matlab
%% Coherence for the IFF plant
coh_ifff_lf = zeros(length(f), 6, 6);
coh_ifff_hf = zeros(length(f), 6, 6);

for i = 1:6
    coh_ifff_lf(:, :, i) = mscohere(meas_data_lf{i}.Va, meas_data_lf{i}.Vs, win, [], [], 1/Ts);
    coh_ifff_hf(:, :, i) = mscohere(meas_data_hf{i}.Va, meas_data_hf{i}.Vs, win, [], [], 1/Ts);
end

```

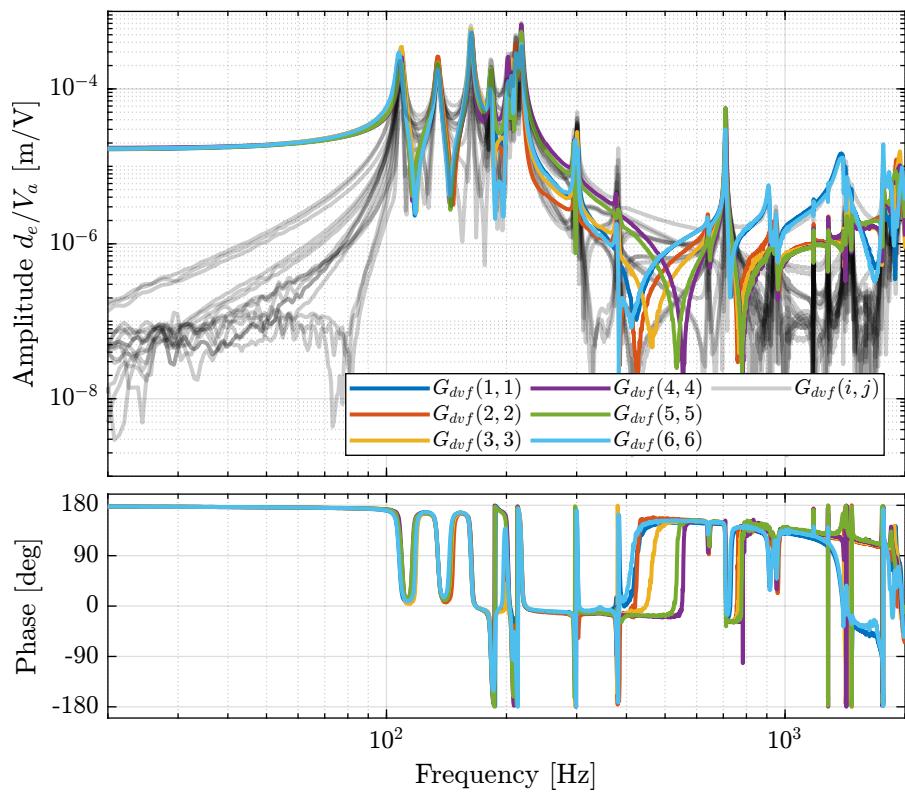

Figure 1.2: Measured FRF for the DVF plant

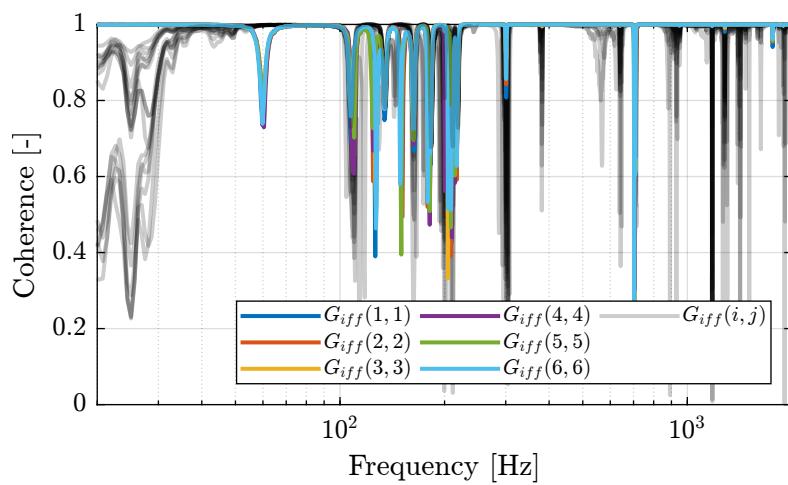

Figure 1.3: Obtained coherence for the IFF plant

Then the 6x6 transfer function matrix is estimated (Figure 1.4).

```
Matlab
%% IFF Plant
G_ifff_lf = zeros(length(f), 6, 6);
G_ifff_hf = zeros(length(f), 6, 6);

for i = 1:6
    G_ifff_lf(:, :, i) = tfestimate(meas_data_lf{i}.Va, meas_data_lf{i}.Vs, win, [], [], 1/Ts);
    G_ifff_hf(:, :, i) = tfestimate(meas_data_hf{i}.Va, meas_data_hf{i}.Vs, win, [], [], 1/Ts);
end
```

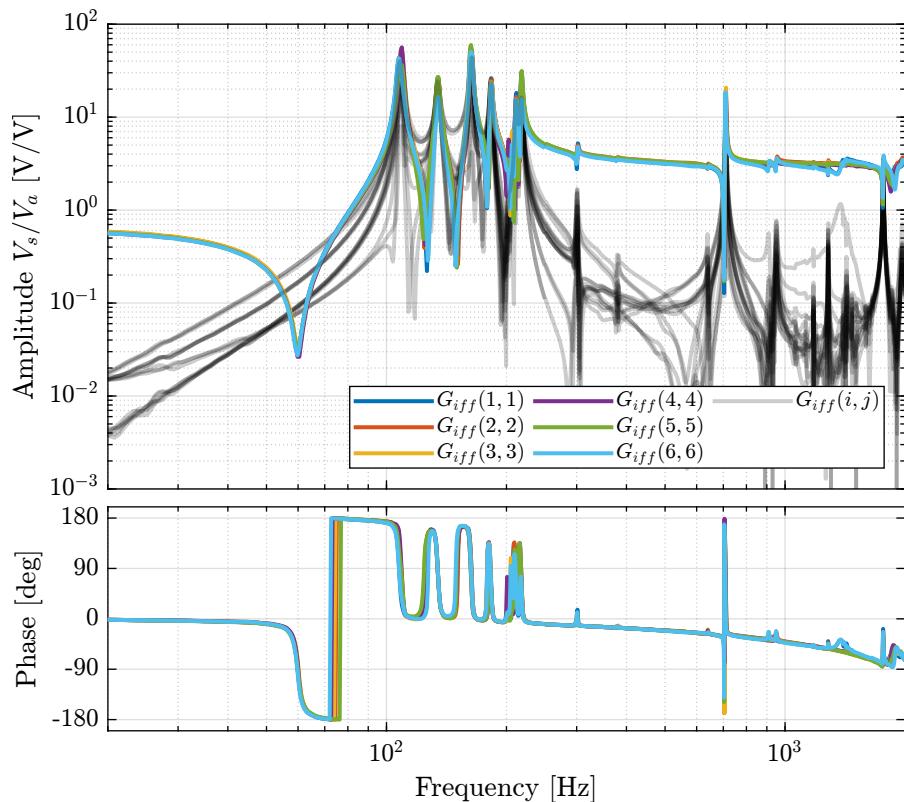

Figure 1.4: Measured FRF for the IFF plant

1.3 Comparison with the Simscape Model

In this section, the measured dynamics is compared with the dynamics estimated from the Simscape model.

1.3.1 Dynamics from Actuator to Force Sensors

```
Matlab
%% Initialize Nano-Hexapod
n_hexapod = initializeNanoHexapodFinal('flex_bot_type', '4dof', ...
```

```

'flex_top_type', '4dof', ...
'motion_sensor_type', 'struts', ...
'actuator_type', '2dof');

```

```

Matlab
_____
%% Identify the IFF Plant (transfer function from u to taum)
clear io; io_i = 1;
io(io_i) = linio([mdl, '/F'], 1, 'openinput'); io_i = io_i + 1; % Actuator Inputs
io(io_i) = linio([mdl, '/Fm'], 1, 'openoutput'); io_i = io_i + 1; % Force Sensors
Giff = exp(-s*Ts)*linearize(mdl, io, 0.0, options);

```

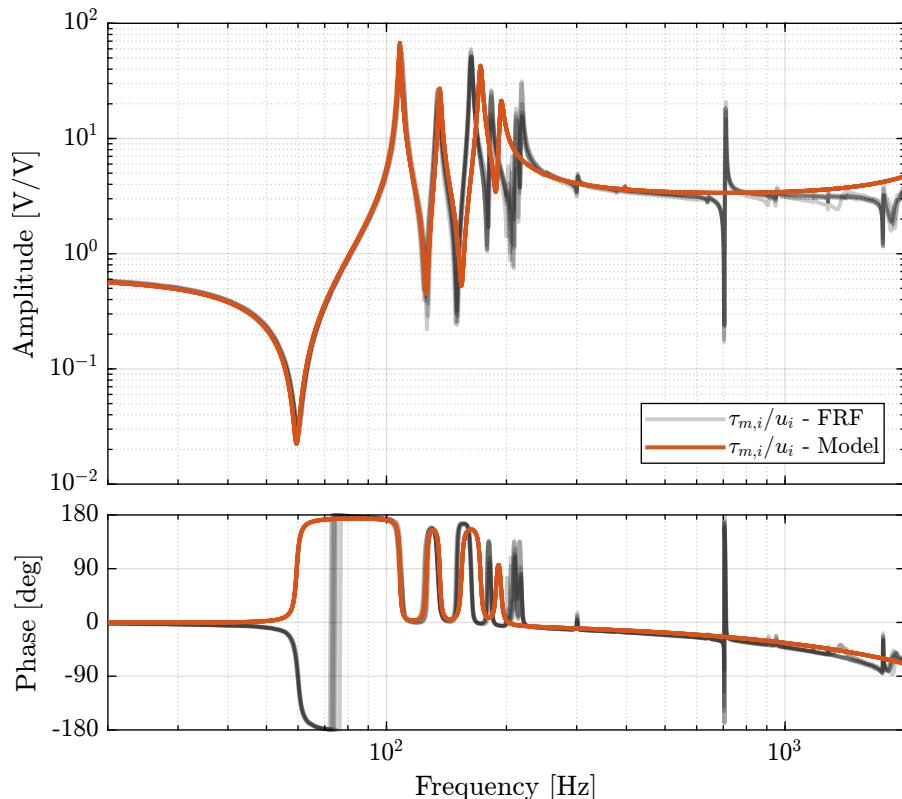

Figure 1.5: Diagonal elements of the IFF Plant

1.3.2 Dynamics from Actuator to Encoder

```

Matlab
_____
%% Initialization of the Nano-Hexapod
n_hexapod = initializeNanoHexapodFinal('flex_bot_type', '4dof', ...
                                         'flex_top_type', '4dof', ...
                                         'motion_sensor_type', 'struts', ...
                                         'actuator_type', '2dof');

```

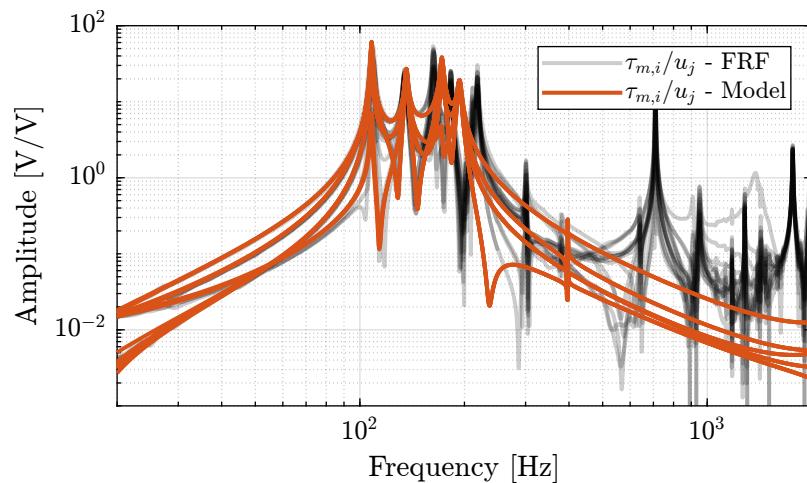

Figure 1.6: Off diagonal elements of the IFF Plant

```
Matlab
%% Identify the DVF Plant (transfer function from u to dLm)
clear io; io_i = 1;
io(io_i) = linio([mdl, '/F'], 1, 'openinput'); io_i = io_i + 1; % Actuator Inputs
io(io_i) = linio([mdl, '/D'], 1, 'openoutput'); io_i = io_i + 1; % Encoders
Gdvf = exp(-s*Ts)*linearize(mdl, io, 0.0, options);
```

1.4 Integral Force Feedback

1.4.1 Root Locus and Decentralized Loop gain

```
Matlab
%% IFF Controller
Kiff_g1 = (1/(s + 2*pi*40))*... % Low pass filter (provides integral action above 40Hz)
           (s/(s + 2*pi*30))*... % High pass filter to limit low frequency gain
           (1/(1 + s/2/pi/500))*... % Low pass filter to be more robust to high frequency resonances
           eye(6); % Diagonal 6x6 controller
```

Then the “optimal” IFF controller is:

```
Matlab
%% IFF controller with Optimal gain
Kiff = g*Kiff_g1;
```

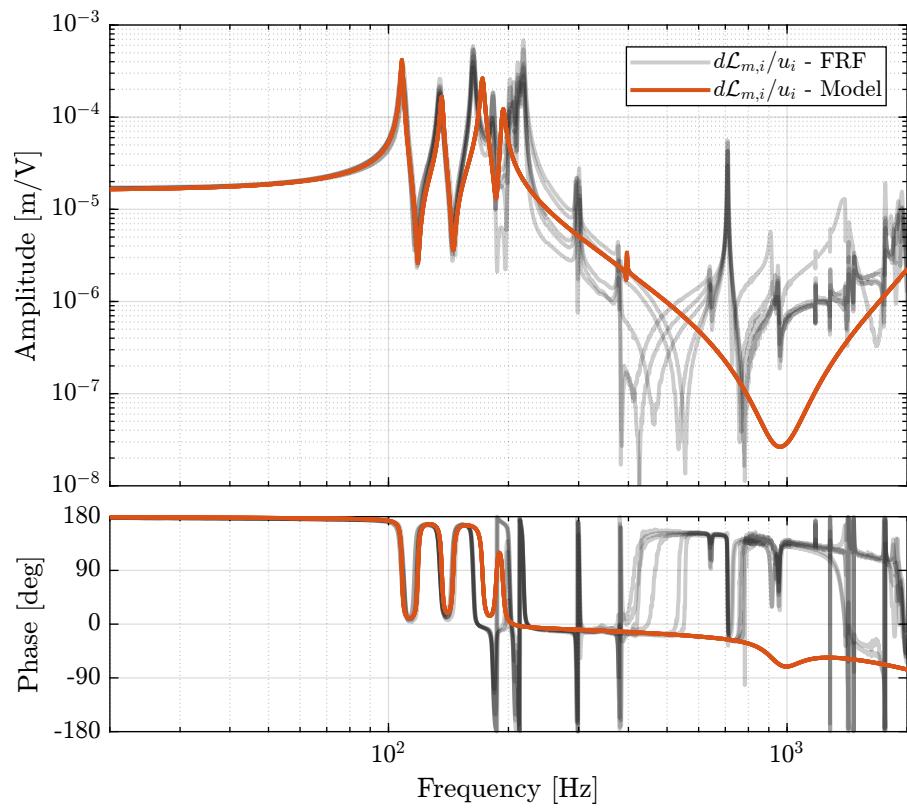

Figure 1.7: Diagonal elements of the DVF Plant

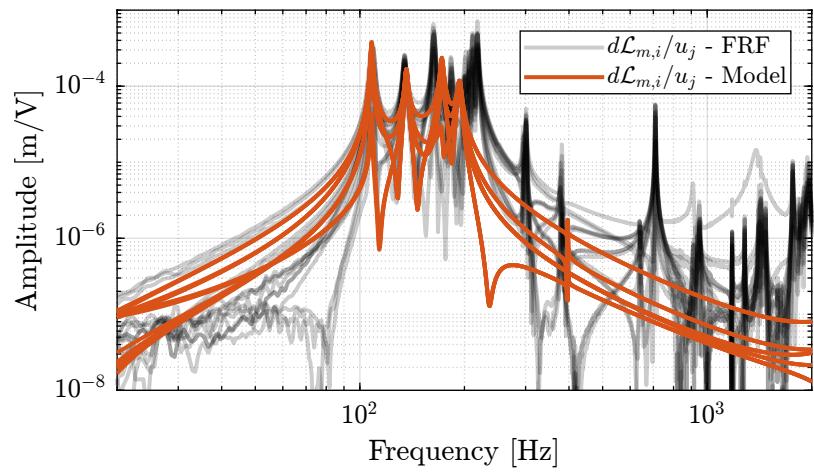

Figure 1.8: Off diagonal elements of the DVF Plant

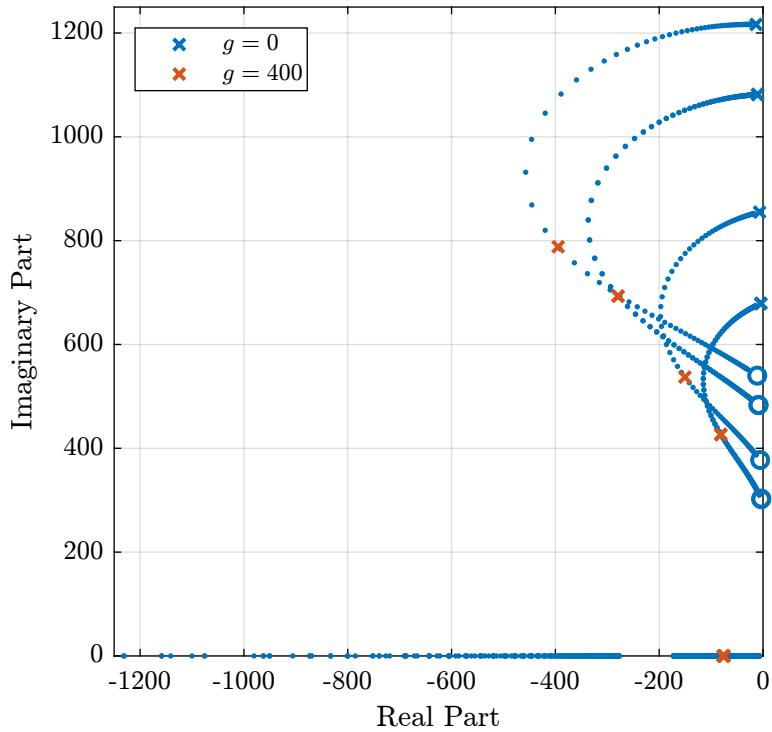

Figure 1.9: Root Locus for the IFF control strategy

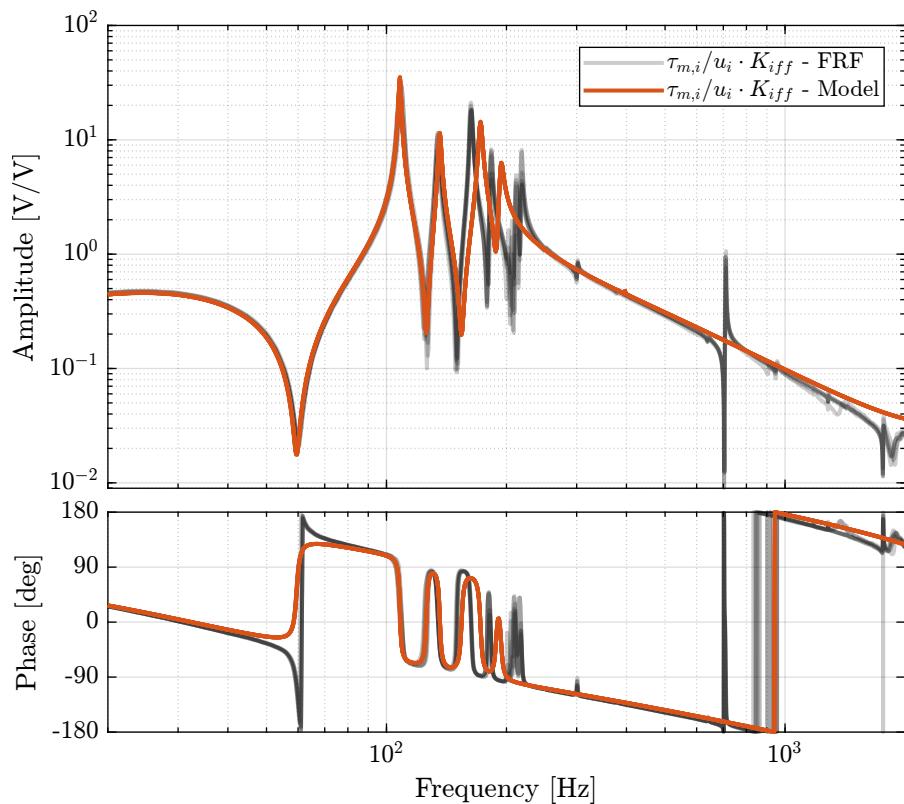

Figure 1.10: Bode plot of the “decentralized loop gain” $G_{\text{iff}}(i, i) \times K_{\text{iff}}(i, i)$

1.4.2 Multiple Gains - Simulation

```
Matlab
%% Tested IFF gains
iff_gains = [4, 10, 20, 40, 100, 200, 400];
```

```
Matlab
%% Initialize the Simscape model in closed loop
n_hexapod = initializeNanoHexapodFinal('flex_bot_type', '4dof', ...
                                         'flex_top_type', '4dof', ...
                                         'motion_sensor_type', 'struts', ...
                                         'actuator_type', '2dof', ...
                                         'controller_type', 'iff');
```

```
Matlab
%% Identify the (damped) transfer function from u to dLm for different values of the IFF gain
Gd_ifff = {zeros(1, length(iff_gains))};

clear io; io_i = 1;
io(io_i) = linio([mdl, '/F'], 1, 'openinput'); io_i = io_i + 1; % Actuator Inputs
io(io_i) = linio([mdl, '/D'], 1, 'openoutput'); io_i = io_i + 1; % Strut Displacement (encoder)

for i = 1:length(iff_gains)
    Kiff = iff_gains(i)*Kiff_g1*eye(6); % IFF Controller
    Gd_ifff{i} = {exp(-s*T_s)*linearize(mdl, io, 0.0, options)};

    isstable(Gd_ifff{i})
end
```

1.4.3 Experimental Results - Gains

Let's look at the damping introduced by IFF as a function of the IFF gain and compare that with the results obtained using the Simscape model.

Load Data

```
Matlab
%% Load Identification Data
meas_ifff_gains = {};

for i = 1:length(iff_gains)
    meas_ifff_gains(i) = {load(sprintf('mat/iff_strut_1_noise_g_%i.mat', iff_gains(i))), 't', 'Vexc', 'Vs', 'de', 'u'};
end
```

Spectral Analysis - Setup

```
Matlab
%% Setup useful variables
% Sampling Time [s]
Ts = (meas_ifff_gains{1}.t(end) - (meas_ifff_gains{1}.t(1)))/(length(meas_ifff_gains{1}.t)-1);
```

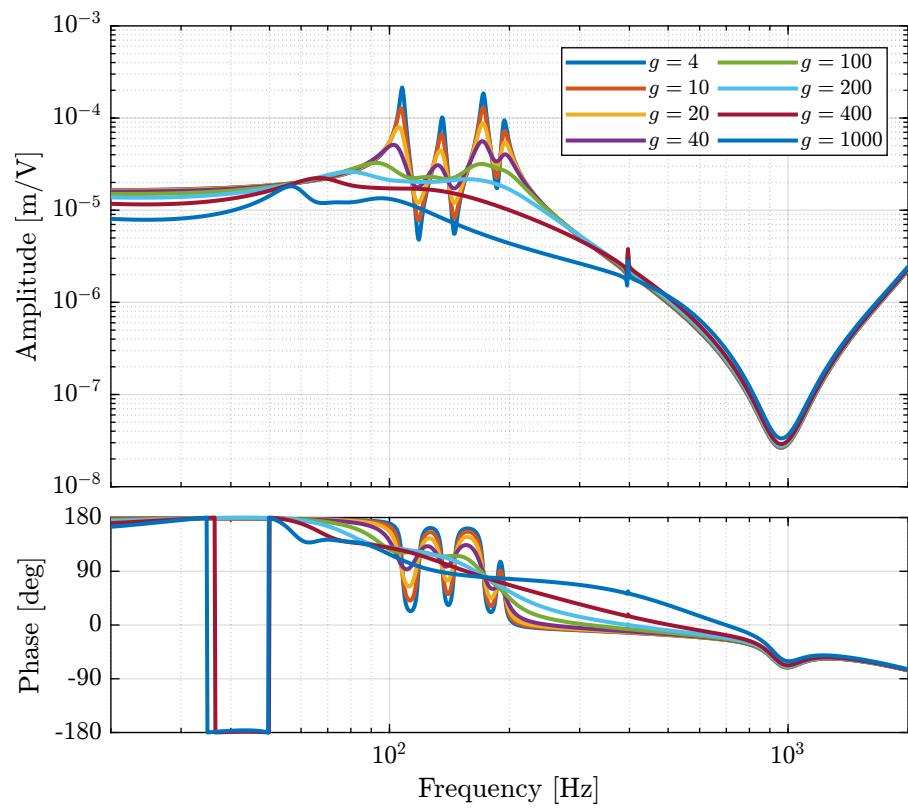

Figure 1.11: Effect of the IFF gain g on the transfer function from τ to $d\mathcal{L}_m$

```
% Sampling Frequency [Hz]
Fs = 1/Ts;

% Hannning Windows
win = hanning(ceil(1*Fs));

% And we get the frequency vector
[~, f] = tfestimate(meas_ifff_gains{1}.Vexc, meas_ifff_gains{1}.de, win, [], [], 1/Ts);
```

DVF Plant

Matlab

```
%% DVF Plant (transfer function from u to dLm)
G_ifff_gains = {};

for i = 1:length(ifff_gains)
    G_ifff_gains{i} = tfestimate(meas_ifff_gains{i}.Vexc, meas_ifff_gains{i}.de(:,1), win, [], [], 1/Ts);
end
```

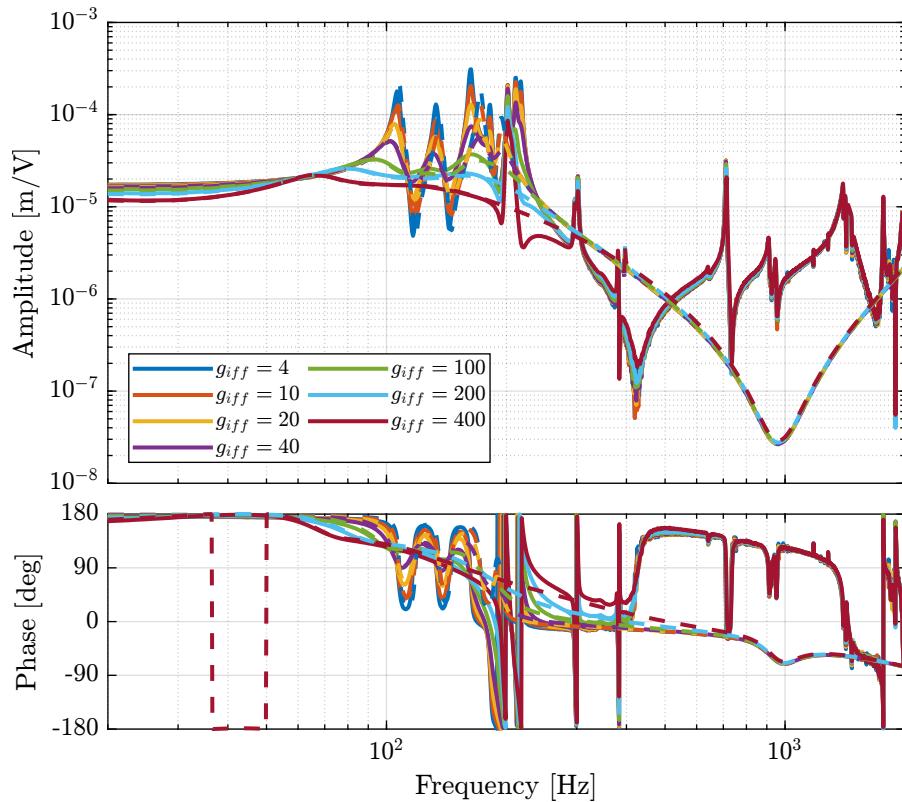

Figure 1.12: Transfer function from u to $d\mathcal{L}_m$ for multiple values of the IFF gain

Important

The IFF control strategy is very effective for the damping of the suspension modes. It however does not damp the modes at 200Hz, 300Hz and 400Hz (flexible modes of the APA). This is very

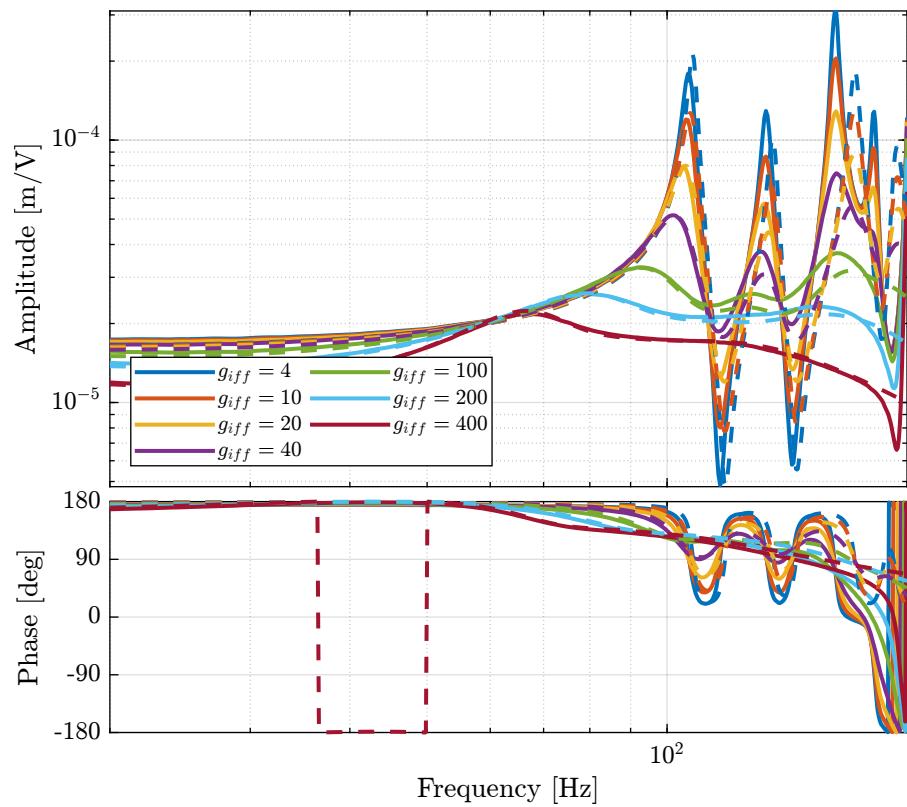

Figure 1.13: Transfer function from u to $d\mathcal{L}_m$ for multiple values of the IFF gain (Zoom)

logical.

Also, the experimental results and the models obtained from the Simscape model are in agreement.

Experimental Results - Comparison of the un-damped and fully damped system

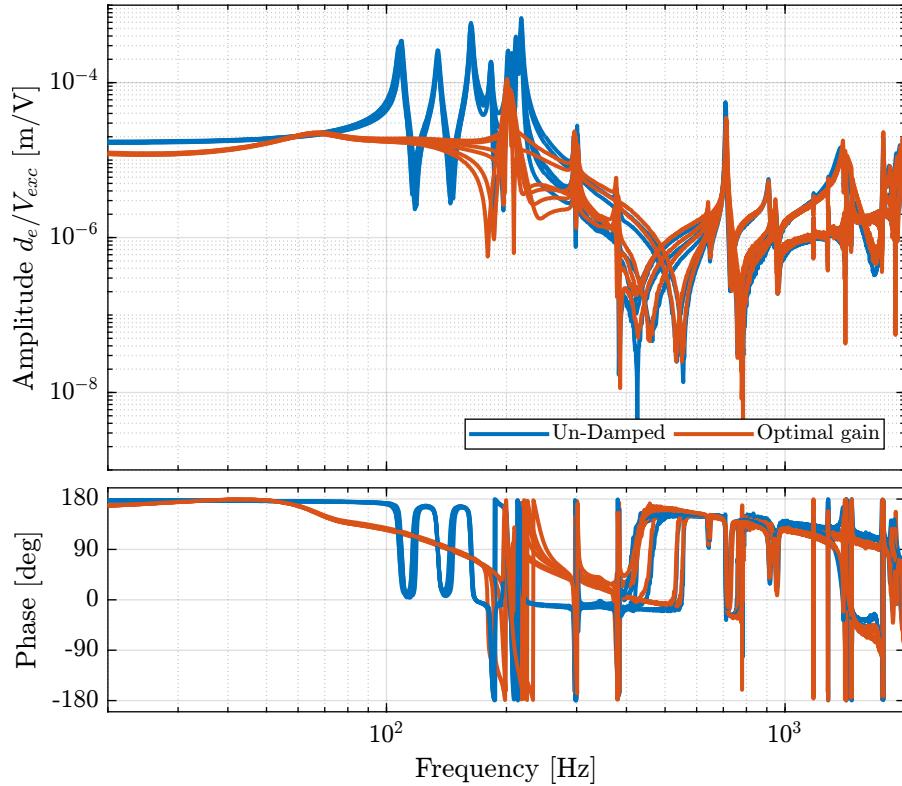

Figure 1.14: Comparison of the diagonal elements of the tranfer function from \mathbf{u} to $d\mathcal{L}_m$ without active damping and with optimal IFF gain

1.4.4 Experimental Results - Damped Plant with Optimal gain

Let's now look at the 6×6 damped plant with the optimal gain $g = 400$.

Load Data

```
%> Load Identification Data
meas_ifff_struts = {};
for i = 1:6
    meas_ifff_struts(i) = {load(sprintf('mat/iff_strut_%i_noise_g_400.mat', i), 't', 'Vexc', 'Vs', 'de', 'u')};
end
```

Spectral Analysis - Setup

```
Matlab
%% Setup useful variables
% Sampling Time [s]
Ts = (meas_ifff_struts{1}.t(end) - (meas_ifff_struts{1}.t(1)))/(length(meas_ifff_struts{1}.t)-1);

% Sampling Frequency [Hz]
Fs = 1/Ts;

% Hannning Windows
win = hanning(ceil(1*Fs));

% And we get the frequency vector
[~, f] = tfestimate(meas_ifff_struts{1}.Vexc, meas_ifff_struts{1}.de, win, [], [], 1/Ts);
```

DVF Plant

```
Matlab
%% DVF Plant (transfer function from u to dLm)
G_ifff_opt = {};

for i = 1:6
    G_ifff_opt{i} = tfestimate(meas_ifff_struts{i}.Vexc, meas_ifff_struts{i}.de, win, [], [], 1/Ts);
end
```

Important

With the IFF control strategy applied and the optimal gain used, the suspension modes are very well damped. Remains the undamped flexible modes of the APA, and the modes of the plates. The Simscape model and the experimental results are in very good agreement.

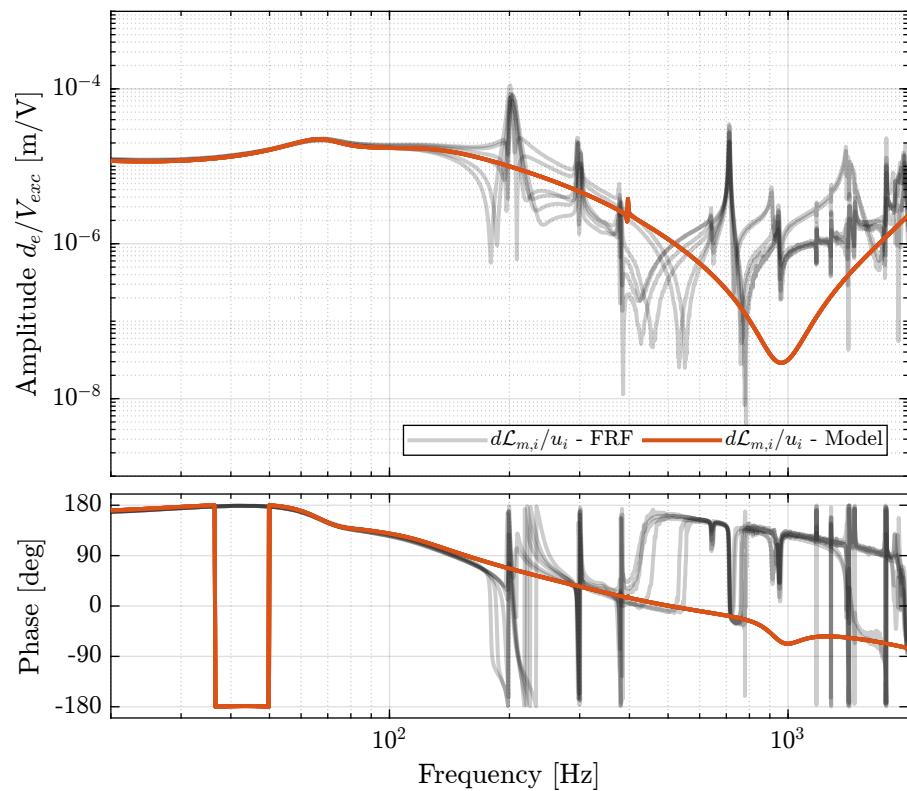

Figure 1.15: Comparison of the diagonal elements of the transfer functions from \mathbf{u} to $d\mathcal{L}_m$ with active damping (IFF) applied with an optimal gain $g = 400$

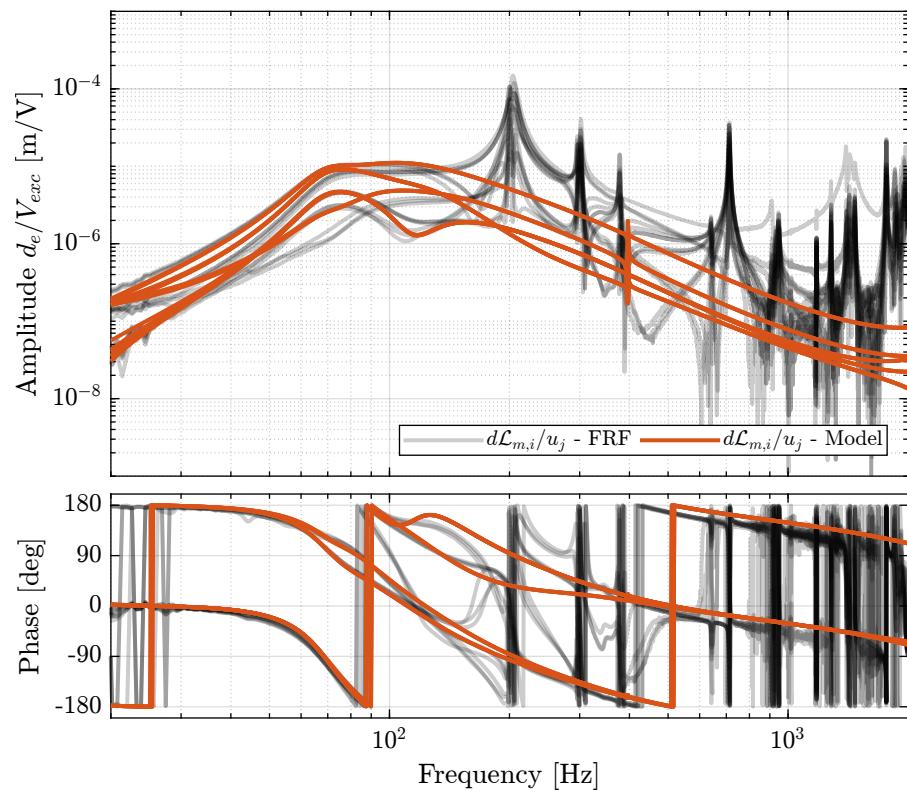

Figure 1.16: Comparison of the off-diagonal elements of the transfer functions from \mathbf{u} to $d\mathcal{L}_m$ with active damping (IFF) applied with an optimal gain $g = 400$

2 Encoders fixed to the plates
